Path diagrams as a notational formalism (Noodling around with pictures)

Vince Wiggins Vice President, Scientific Development StataCorp LP

2013 London Stata Users Group Meeting

< 6 b

- Sometimes path diagrams are used in lieu of mathematical notation to define and explain models.
- How far can they be pushed?

V. Wiggins (StataCorp)

Path diagrams as a notational formalism

They can be:

- an error term
- a random intercept
- part of a random slope
- a frailty
- a creator/modeler of endogeneity
- a creator/modeler of sample selection
- a creator/modeler of endogenous treatment effects
- part of a switching model
- or any other latent/unobserved thingy

Linear regression

Mathematical notation for a linear regression

$$y_i = \beta_0 + \beta_1 x \mathbf{1}_i + \beta_2 x \mathbf{2}_i + \epsilon_i$$

$$\epsilon_j \sim Normal(0, \sigma_{\epsilon})$$

Path notation for a multilevel model — with maths

V. Wiggins (StataCorp)

Path diagrams as a notational formalism

Every diagram in this talk was drawn with it.

They each took 2 or 3 minutes to draw.

They can all be estimated by sem or gsem.

Let's draw one ...

If you are reading this online, you just had to be there.

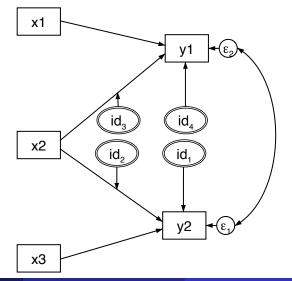

Linear multivariate (seemingly unrelated) multilevel model

Mathematical notation

$$\begin{array}{l} y\mathbf{1}_{ji} = \beta_{0a} + \beta_{1}x\mathbf{1}_{ji} + (\beta_{2} + \mu\mathbf{1}_{j})x\mathbf{2}_{ji} + \mu\mathbf{0}_{j} + \epsilon\mathbf{1}_{ji} \\ y\mathbf{2}_{ji} = \beta_{0b} + \beta_{3}x\mathbf{3}_{ji} + (\beta_{4} + \mu\mathbf{2}_{j})x\mathbf{2}_{ji} + \mu\mathbf{3}_{j} + \epsilon\mathbf{2}_{ji} \\ \mu\mathbf{0}_{j} \sim \textit{Normal}(\mathbf{0}, \sigma_{\mu\mathbf{0}}) \\ \mu\mathbf{1}_{j} \sim \textit{Normal}(\mathbf{0}, \sigma_{\mu\mathbf{1}}) \\ \mu\mathbf{2}_{j} \sim \textit{Normal}(\mathbf{0}, \sigma_{\mu\mathbf{2}}) \\ \mu\mathbf{3}_{j} \sim \textit{Normal}(\mathbf{0}, \sigma_{\mu\mathbf{3}}) \\ j \quad \textit{indexes levels} \end{array}$$

Linear multivariate (seemingly unrelated) multilevel model

V. Wiggins (StataCorp)

Path diagrams as a notational formalism

Variations on the linear multivariate multilevel model

What if the random effects are shared?

- Easy enough in the mathematical notation, but easier to see in the path diagram. Let's edit the path diagram ...
- I am sorry once again to those following at home.

What if the random effects are shared?

- Easy enough in the mathematical notation, but easier to see in the path diagram. Let's edit the path diagram ...
- I am sorry once again to those following at home.

What if the random coefficients on x2 are the same for both y's?

- Again, very easy to see (and to change) on the path diagram ...
- Must explicitly constrain paths/coefficients from latent variables.

What if the random effects are shared?

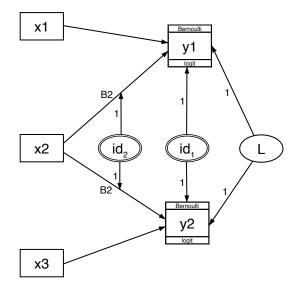

- Easy enough in the mathematical notation, but easier to see in the path diagram. Let's edit the path diagram ...
- I am sorry once again to those following at home.

What if the random coefficients on x2 are the same for both y's?

- Again, very easy to see (and to change) on the path diagram ...
- Must explicitly constrain paths/coefficients from latent variables.

What if the outcomes were 0/1 and we wanted to model them as logistic?

- We would add some probabilistic statements to our mathematical notation. And likely some verbal explanation.
- We can also designate this on the path diagram ...

4 A N

Selection with an endogenous covariate in a multilevel framework — path diagram

Compared to math, path diagrams are:

- easier to understand
- more attuned to human perception
- Iess precise
- Iess flexible
- more amenable to noodling

Don't choose.

Use what works — words, maths, paths.
